

Project: HIPAA Hero - Retro Arcade Annual Compliance Trainer

Objective

Build a fully static, browser-based training application using only HTML, CSS, and JavaScript.

The application is designed for clinic employees to complete their annual HIPAA compliance refresher training through an engaging retro arcade experience rather than a traditional slideshow.

There will be no backend, database, login system, or server-side processing.

All data should exist as local JSON or JavaScript objects so the site can be hosted for free on GitHub Pages, Netlify, Cloudflare Pages, or any static web host.

The application must be modular, easy to update, and simple to maintain.

Overall Theme

Design Style:

Retro Arcade (1980s 8-Bit)

Visual Characteristics

- Dark background
- Neon accents
- Pixel art inspiration
- Chunky borders
- Thick outlines
- Bright primary colors
- Minimal gradients
- Pixel fonts
- Heavy shadow effects (no blur)
- CRT arcade feeling
- Fun but professional enough for healthcare staff

The experience should feel like an old-school arcade cabinet teaching HIPAA.

Think:

"Compliance meets classic Nintendo."

Technology

Use only:

HTML5

CSS3

Vanilla JavaScript

No frameworks.

No React.

No Vue.

No Angular.

No TypeScript.

No Node dependencies.

No package manager.

No build process.

Everything should run by opening index.html.

Knowledge Base

The application should load all educational material from JSON.

I will later provide:

HIPAA definitions

Policies

Security rules

Privacy rules

Examples

Scenarios

Violations

Best practices

These should populate:

Quiz questions

Flash cards

Glossary

Review pages

without editing JavaScript.

Training Modules

Support multiple categories.

Example:

Module 1
HIPAA Basics

Module 2
Protected Health Information

Module 3
Privacy Rule

Module 4
Security Rule

Module 5
Patient Rights

Module 6
Data Handling

Module 7
Email & Communication

Module 8
Physical Security

Module 9
Cybersecurity

Module 10
Reporting Incidents

Each module contains:

Learning cards

Examples

Interactive checkpoints

Mini quiz

Completion badge

Quiz Engine

Support:

Multiple Choice

True / False

Select All That Apply

Scenario Based Questions

Image Questions (future)

Randomized questions

Randomized answers

Tags

Example schema:

```
{
  "id": 1,
  "category": "Privacy Rule",
  "difficulty": "Easy",
  "question": "...",
  "answers": [
    "...",
    "...",
    "...",
    "..."
  ],
  "correct": 2,
  "explanation": "...",
  "reference": "...",
  "tags": ["privacy"]
}
```

Future Expansion

The architecture should allow easy addition of:

More modules

Additional question banks

Multiple exams

Department-specific training

Custom branding

Certificates

Leaderboards

Animated mascots

Multilingual support

Voice narration

No major code rewrites should be required.

Code Quality Requirements

Write clean, modular, well-commented code.

Separate concerns:

UI

Logic

Storage

Quiz engine

Data

Avoid duplicated code.

Use reusable functions.

Favor readability over cleverness.

Final Goal

Create a polished, arcade-inspired HIPAA compliance trainer that transforms mandatory annual training into an engaging game-like experience while remaining entirely static, lightweight, fast-loading, and easy to maintain. The application should be flexible enough that future HIPAA content updates only require editing JSON data files rather than modifying application logic. The

management should be able to get an email once people are complete. We will also want to connect a spreadsheet to update employees that have completed training. The bottom tag of the website will say "Created By Sbas info LLC 2026"
